Implement all pair shortest paths problem using Floyd's algorithm.

→ Solution.

Using C language.

```
#include <stdio.h>
```

```
int min(int, int);
```

```
void floyds(int p[10][10], int n)
```

```
{
```

```
    int i, j, k;
```

```
    for (k = 1; k ≤ n; k++)
```

```
        for (i = 1; i ≤ n; i++)
```

```
            for (j = 1; j ≤ n; j++)
```

```
                if (i == j)
```

```
                    p[i][j] = 0;
```

```
                else
```

```
                    p[i][j] = min(p[i][j], p[i][k] + p[k][j]);
```

```
}
```

```
int min(int a, int b)
```

```
{
```

```
    if (a < b)
```

```
        return a;
```

```
else  
    return (b);
```

```
}
```

```
int main()
```

```
{
```

```
    int p[10][10], w, n, e, u, v, i, j;
```

```
    printf("\n Number of vertices: ");
```

```
    scanf("%d", &n);
```

```
    printf("\n Enter no. of edges: ");
```

```
    scanf("%d", &e);
```

```
    for(i=1; i≤n; i++)
```

```
    {
```

```
        for(j=1; j≤n; j++)
```

```
            p[i][j] = 999;
```

```
    }
```

```
    for(i=1; i≤e; i++)
```

```
    {
```

```
        printf("\n Enter end vertices of edge with weight, i);
```

```
        scanf("%d %d %d", &u, &v, &w);
```

```
        p[u][v] = w;
```

```
    }
```

```
    printf("\n Matrix of input ");
```

```
    for(i=1; i≤n; i++)
```

```
    {
```

```
        for(j=1; j≤n; j++)
```

```
            printf("%d ", p[i][j]);
```

```
        printf("\n");
```

```
    }
```

2. (9)

```

floyd(p, n);
printf("\n Transitive Closure: \n");
for(i=1; i≤n; i++)
{
    for(j=1; j≤n; j++)
        printf("%d ", p[i][j]);
    printf("\n");
}
printf("\n The shortest paths are: \n");
for(i=1; i≤n; i++)
    for(j=1; j≤n; j++)
    {
        if(i≠j)
            printf("\n <%d; %d>=%d", i, j, p[i][j]);
    }
}
}

```

The time complexity of this algorithm is,
 $O(\text{vertices}^3)$.

Foreg If no. of vertices is 3.
 Time complexity is $O(3^3)$.

Sample Output:

Enter number of vertices: 4.

Enter number of edges: 4.

Enter end vertices of edge 1 with its weight.

1 3 2.

Enter the end vertices of edge 2 with its weight.

4 1 2

Enter the end vertices of edge 3 with its weight.

4 2 1.

Enter the end vertices of edge 4 with its weight.

2 3 4.

Matrix of input data:

999	999	2	999
999	999	4	999
999	999	999	999
2	1	999	999

[Here, 999 denotes infinite distance]

Transitive closure.

0	999	2	999
999	0	4	999
999	999	0	999
2	1	4	0

The shortest path are:

$$\langle 1, 2 \rangle = 999$$

$$\langle 1, 3 \rangle = 2$$

$$\langle 1, 4 \rangle = 999$$

$$\langle 2, 1 \rangle = 999$$

$$\langle 2, 3 \rangle = 4$$

$$\langle 2, 4 \rangle = 999$$

$$\langle 3, 1 \rangle = 999$$

$$\langle 3, 2 \rangle = 999$$

$$\langle 3, 4 \rangle = 999$$

$$\langle 4, 1 \rangle = 2$$

$$\langle 4, 2 \rangle = 1$$

$$\langle 4, 3 \rangle = 4$$
